Instruction for use
Torque wrench (TW50)

Application
Torque ratchet for inserting and removing dental screws with a defined torque. The torque function can also be “blocked”; the blocked position enables greater torque to be transferred when placing implants, and allows connections to be loosened.

The torque ratchet may only be used by trained dental specialists.

Handling
Prosthodontic setting – torque function: The desired torque can be continuously set via the spring using the adjusting nut. The scale on the scale sleeve shows the setting.
Surgery setting – blocked function: Turn adjusting nut to scale mark ∞ (infinite). Do not tighten excessively. Store without tension at 10 Ncm.

Caution! The ratchet must not be subjected to stress above 100 Ncm. Do not loosen the two adjusting nut screws (X), as this leads to a loss of calibration.

Exchanging tools
Using thumb and index finger, pull the post back on both sides in the direction of the arrow and remove or insert tool.

Correct handling of torque release
The pressure point for accurate torque release is located exclusively on the handle of the adjusting nut (see arrow). Release by pressing with finger only. Do not touch the handle with thumb and index finger to release.
When the set torque is reached, the scale sleeve snaps around the axis in the ratchet head. The release can be heard and felt.

Do not continue to press after the torque is released. The ratchet or dental components could be damaged.

When the handle is released the ratchet returns to the starting position.
Reprocessing:

| Instruction for cleaning, disinfection and sterilization of non-sterile and reusable medical devices Dental Implant System ROOTT |

Preparation

Treatment instructions/warnings

| To avoid damage, do not use metal brushes or cleaning sponges. |

Only use cleaning and disinfectant solutions with a pH value of between 4.5 and 10. Follow the manufacturer's instructions (e.g., intended purpose, dosage, exposure period and replacement of the solution).

The ratchet is not sterile when delivered and must be cleaned and sterilised before it is used.

| When using several torque ratchets, do not interchange the individual parts. Each individual part belongs to the respective instrument. |

Restriction regarding repreparation

The end of the product's service life is normally determined by wear and damage caused during use and by incorrect handling.

Preparation for cleaning

The torque ratchet can be disassembled into its individual parts, without the need for tools, by completely unscrewing the adjusting nut.

Do not lose the plastic disc as this will impair the instrument's accuracy.

The plastic disc does not normally need to be removed. If necessary, the disc can be pulled out. After cleaning, reinsert the disc.

Clean the parts under cold running water using a soft brush to remove all visible soiling. Ensure that all openings and cavities are thoroughly rinsed. Do not allow blood and other soiling to dry on.

For manual and automatic cleaning and disinfection follow the “Instruction for cleaning, disinfection and sterilization of non-sterile and reusable medical devices Dental Implant System ROOTT”.

Maintenance, inspection and testing

Allow the parts to cool to room temperature and visually inspect them for residues of proteins and other soiling. If necessary, repeat the preparation steps.

Lightly lubricate the areas marked using contra-angle handpiece oil. Assemble ratchet and carry out functional test.
Sterilization packaging

Place the ratchet into packaging suitable for sterilization according to ISO 11607 and EN 868. The bag must be large enough for the instrument. Closures must not be under tension.

Sterilization

Sterilization for Torque Wrench is performed according to the “Instruction for cleaning, disinfection and sterilization of non sterile and reusable medical devices Dental Implant System ROOTT”.

After sterilization, inspect the sterile packaging for damage and check sterilization indicators.

Storage

Store the ratchet without tension at 10 Ncm, at a moderate temperature, and in a dry, dust-free, well-ventilated place, in which there is no corrosive steam.

Calibration

Manufacturer recommend annual calibration of the ratchet. The ratchet must be cleaned and sterilised before shipping, otherwise the product will be returned to the manufacturer for calibration. For this purpose, please contact our TRATE Quality Department via our web page: www.trate.com

Further information

This medical product is CE marked in accordance with Directive 93/42/EEC on medical device.

Validity

Upon publication of these instructions for use (IFU), all previous versions are superseded.
